

Long-Range, Wireless Voice Doorbell

The Wireless Voice Doorbell allows a delivery driver, employee, or visitor to quickly notify radio-equipped staff of their arrival at a specific locked door.

Minimize wasteful wait-time and delay for outside arrivals. Enables inside staff to remain productive until notification is heard on their two-way radio.

The vandal resistant push button connects to the wireless transmitter installed inside the building. When the button is pressed a pre-recorded location message is transmitted directly to two-way radio equipped personnel inside.

Portable radio not included with RQA-DB

Simple to install.

Uses robust, long-range, narrow band wireless technology; the unit talks directly to your business band two-way radios. It does not require any additional infrastructure or monthly fees, and does not use Wi-Fi technology, minimizing ongoing support needs. It is powered by 6 AA alkaline batteries, providing approximately 1 year of service.

Better than a buzzer.

50,000 sq. ft.+ range. 1000x more coverage than a buzzer. Instantly alerts two-way radio-equipped personnel anywhere in the building of an arrival.

Increase employee productivity and safety.

The Wireless Voice Doorbell works with your existing two-way radios to provide a fast and efficient way to improve operational performance, employee safety and productivity.

Uses:

Front-of-Store Early Entry, Back-of-Store (Delivery Door/Loading Dock) areas, Health Screening Entry, other Controlled Entry points.

Works with Business Band Frequency Models:
